

GEOTECHNICAL PEER REVIEW CLIENTS

Geotechnical Peer Review is the process of evaluating geologic and soils reports that are submitted to municipal agencies in support of development applications. The Geotechnical Peer Review process serves to ensure that potential geotechnical hazards (e.g., landslides, earthquake faults, expansive soils, liquefaction, settlement, etc.) are identified and mitigated at the expense of the developer, rather than become liabilities to municipalities and individual homeowners. It has been demonstrated repeatedly that Geotechnical Peer Review dramatically reduces potential losses to both private and public properties, thus protecting the community from severe economic impacts.

CSA has been providing geotechnical peer review services to communities since 1974. In these communities, CSA acts as an extension of the City or Town staff, and frequently participates in meetings with planners and applicants to help resolve geotechnical issues. The specific interaction between municipalities and CSA varies depending on the individual municipality's system and priorities. In some communities, CSA reports directly to the Planning Director during the Design Review phase of the application process. In other communities, CSA works with the Building Department to ensure that final design properly mitigates geotechnical concerns.
